Project Goals and Outcomes

The intended purpose of my website is to learn how to make a keyboard or if there are any experienced builders, a guide on what to add to their next keyboard build. The audience is keyboard enthusiasts and beginners who want to learn how to make their own custom keyboard. This website is supposed to be a beginner-friendly website so the information should be understandable for new users to go through. The primary goal is for users to understand and know what they would want to build for their own keyboard when going through the website. I was trying to accomplish laying out information that is not too overwhelming but also keeping it visually coherent. I would say there are still some improvements I should make but I am not sure how to add them and how I would like them to be laid out. I am satisfied with the recommended brand scroll since it seems the more interesting thing on the website because it is the only thing moving besides the user's eyes when they go through the website.

Development Process

I kind of went with the flow through every progression bar made on this website. I knew what I wanted to make for a website, but I wasn't sure how I would lay it out. I was able to make wireframes to help digest that information and keep my design simple. I would say information cards and flexboxes worked well with this website because there are still more information cards I could make and add to the other pages on my website. Flex boxes help maintain an organized space which helps balance out my website. With the info cards, users will be able to go through information smoothly and it won't overwhelm them with just text because there are visual elements in these cards to help their decision making. I would probably consider a grid of some sort somewhere on my website, but I have not used this technique anywhere on my website.

Maybe it might help with organizing mass amounts of information and creating a visual balance to the page. I am just not sure what I would do with a grid for the information on my website. I wouldn't know how to lay it out and organize with images and information. For creativity, there wasn't much since I wanted to keep the design simple. The only creative thing was the color palette but that still feels simple as well. I probably could have added more design elements besides the icons I made. I did like how the icons came out since they are made according to their pages. I knew about keyboards, but I was not sure how to lay out the information so that it was beginner friendly. So, I started with the basics of knowing about keyboards and I should have probably added links on how to build a keyboard instead of just the information. There is more information to add to this website that I couldn't add.

Critique and Insights

The most insightful thing was that I should also add info cards to my other pages so that it feels connected and probably add more example images to the other pages instead of just my switches page. Viewing other websites helps from a design perspective but with the information I have on my website, I was not sure how to add those design elements since I am not making a personal bio website like a few others were. I would probably prioritize the visual design of my website and come up with ways to design the negative space.

Looking Forward

I would like to carry forward with adding navigation bar, info cards, flex boxes, quotes, icons and probably more that could be added according to the client I choose. I would probably think differently about the information I need for the website and the design elements needed for that website to make it visually appropriate and coherent. Eliminating unnecessary information and space would help as well to make it feel more balanced for the next websites I make. Add

more animation sequences and elements to make the website feel more interactive as well. Getting a visual sketch or wireframe down for each page that is intended would help my work be more effective. For the website I made, I went with the flow and didn't make too many iterations of my wireframes on what I want on each page. So, changing this I believe my work would be more effective by having a better plan for my next website.

Final Reflection

One thing I want to remember for my next project is to make my next design visually creative and coherent. Make the website feel balanced and add information according to its goal and main purpose. Execute with a well-made plan with wireframes to help with the visual elements and know where to place things. Find out more ways on how to add animation effects on the websites and read through the critiques and expand upon them. Don't settle for comfort and go beyond what is required but also don't overwork yourself and overcomplicate things. Add things that are appropriate and remove things that don't fit well, you don't need to add everything only if it applies and brings more to the website.
